**Mark Anderson 0274 691 004**

# INTRODUCTION

## Welcome to Komako Angus 2019 yearling bull sale.

Firstly, thank you to all our loyal and new clients, we very much appreciate your business and support towards our breeding program.

At Komako we are taking the necessary steps to make sure we remain Mycoplasma Bovis and BVD free. We are fortunate to have natural boundaries, being the Ruahine Ranges, two rivers and 2 km of road front. **We also have no cattle trading component.**

Our breeding policies are based very much on **maternal traits, fertility, temperament, cow efficiency and function** on our class of land. Cows need good phenotype with a moderate frame to carry themselves around the hills, and hold condition through the winter. **Low to moderate birth weights, short gestation and calving ease** are essential traits we focus on. Progeny need to show good growth out to 400day, then easing back toward 600day.

All replacement heifers are AI at 15 months then tailed up with a bull for 43 days, anything not in calf is then sold. All females must rear a calf or they are culled. We are at the end of the day commercial farmers, breeding service bulls off true hill country in commercial conditions.

Bulls available have been weighed and tagged at birth. At this point we also assess the mother on temperament, udder and mothering ability. The bulls are again weighed at weaning, and before the sale date.

Regards

*Dave and Nicole*

# KOMAKO BULLS ASSURANCE

## Komako Bulls have all been:

- Weighed and tagged at birth
- Dams are udder, temperament and phenotype scored at calving time
- Born to proven dams that have reared a calf every year since a 2 year old
- Run on true hill country under commercial conditions.
- BVD blood tested clear
- BVD vaccinated twice
- TB status C10
- Scrotal size measured
- Carcass scanned for EMA, IMF, RIB, P8
- Semen tested and assessed for libido
- 6n1 vaccinated.

# KOMAKO ANGUS GUARANTEE

All stud bulls sold are a guaranteed breeder.

Any bull that becomes infertile, or incapable of servicing due to a structural defect within two breeding seasons, will be refunded or partially refunded. The bull needs to be viewed and proved to be in good working condition, a vet certificate will need to be presented for the bull to be infertile or incapable of serving due to a structural defect.

This guarantee does not cover injury or ill treatment.

# CONDITIONS OF SALE

- Each lot becomes the property of the purchaser at the conclusion of the sale.
- Payment made 14 days after the sale, unless prior arrangement has been made with the vendor.
- Although every care has been taken in ensuring the accuracy of this catalogue no responsibility is accepted for any errors that may be included therein.
- G.S.T All bulls sold are G.S.T exclusive.
- Free delivery to Feilding sale yards.

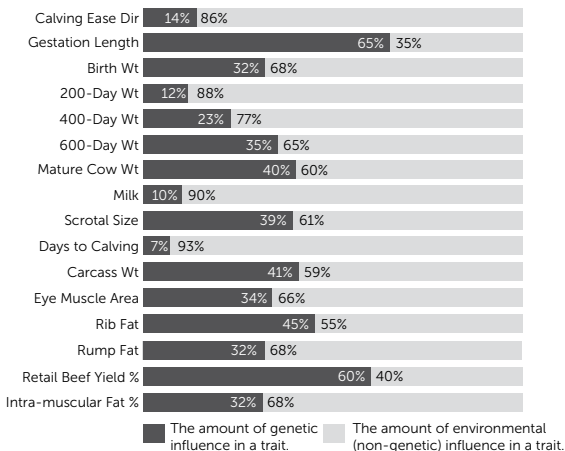

# LOOKING AFTER BULLS

- When bulls arrive at your property please ensure they have some other mates to settle in with, ideally steers with some hay or balage, as it is a whole new environment they're going into.
- Once bulls have finished mating it is important to not forget about them. Bulls will need to be fed adequately to ensure they carry on growing to their potential.

# HEALTH & SAFETY

Every effort will be taken by the Vendors, we wish however to advise that while on the property we run under normal management conditions, certain dangers exist in relation to livestock and their environment. Visitors should take care to ensure their personal safety.

# HERITABILITY ESTIMATES

# EBVS EXPLAINED

## UNDERSTANDING THE EBVS, Selection Indexes and Accuracy

### EBVs

An animal's breeding value is its genetic merit, half of which will be passed on to its progeny. While we will never know the exact breeding value, for performance traits it is possible to make good estimates. These estimates are called Estimated Breeding Values (EBVs).

In the calculation of EBVs, the performance of individual animals within a contemporary group is directly compared to the average of other animals in that group. A contemporary group consists of animals of the same sex and age class within a herd, run under the same management conditions and treated equally. Indirect comparisons are made between animals reared in different contemporary groups, through the use of pedigree links between the groups.

EBVs are expressed in the units of measurement for each particular trait. They are shown as + ive or - ive differences between an individual animal's genetics difference and the genetic base to which the animal is compared. For example, a bull with an EBV of +50 kg for 600-Day Weight is estimated to have genetic merit 50 kg above the breed base of 0 kg. Since the breed base is set to an historical benchmark, the average EBVs of animals in each year drop has changed over time as a result of genetic progress within the breed.

The absolute value of any EBV is not critical, but rather the differences in EBVs between animals. Particular animals should be viewed as being "above or below breed average" for a particular trait.

Whilst EBVs provide the best basis for the comparison of the genetic merit of animals reared in different environments and management conditions, they can only be used to compare animals analysed within the same analysis. Consequently, NZ ANGUS BREEDPLAN EBVs cannot be validly compared with EBVs for any other breed.

Although EBVs provide an estimate of an animal's genetic merit for a range of production traits, they do not provide information for all of the traits that must be considered during selection of functional animals. In all situations, EBVs should be used in conjunction with visual assessment for other traits of importance (such as structural soundness, temperament, fertility etc). A recommended practice is to firstly select breeding stock based on EBVs and to then select from this group to ensure that the final selections are otherwise acceptable.

EBVs are published for a range of traits covering fertility, calving ease, milking ability, growth, carcase merit and feed efficiency. When using EBVs to assist in selection decisions it is important to achieve a balance between the different groups of traits and to place emphasis on those traits that are important to the particular

herd, markets and environment. One of the advantages of having a comprehensive range of EBVs is that it is possible to avoid extremes in particular traits and select for animals with balanced overall performance.

**Calving Ease EBVs (%)** are based on calving difficulty scores, birth weights and gestation length information. More positive EBVs are favourable and indicate easier calving.

**CE % Direct = Direct Calving Ease** - The EBV for direct calving ease indicates the influence of the sire on calving ease in purebred females calving at two years of age.

**CE % Daughters = Daughters' Calving Ease** - The EBV for daughters' calving ease indicates how easily that sire's daughters will calve at two years of age.

**Gestation Length EBV (days)** is an estimate of the time from conception to the birth of the calf and is based on AI and hand mating records. Lower (negative) GL EBVs indicate shorter gestation length and therefore easier calving and increased growth after birth.

**Birth Weight EBV (kg)** is based on the measured birth weight of progeny, adjusted for dam age. The lower the value, the lighter the calf at birth and the lower the likelihood of a difficult birth. This is particularly important when selecting sires for use over heifers.

**200-Day Growth EBV (kg)** is calculated from the weight of progeny taken between 80 and 300 days of age. Values are adjusted to 200 days and for age of dam. This EBV is the best single estimate of an animal's genetic merit for growth to early ages.

**400-Day Weight EBV (kg)** is calculated from the weight of progeny taken between 301 and 500 days of age, adjusted to 400 days and for age of dam. This EBV is the best single estimate of an animal's genetic merit for yearling weight.

**600-Day Weight EBV (kg)** is calculated from the weight of progeny taken between 501 and 900 days of age, adjusted to 600 days and for age of dam. This EBV is the best single estimate of an animal's genetic merit for growth beyond yearling age.

**Mature Cow Weight EBV (kg)** is based on the cow weight when the calf is weighed for weaning, adjusted to 5 years of age. This EBV is an estimate of the genetic difference in cow weight at 5 years of age and is an indicator of growth at later ages and potential feed maintenance requirements of the females in the breeding herd. Steer breeders wishing to grow animals out to a larger weight may also use the Mature Cow Weight EBV.

**Milk EBV (kg)** is an estimate of an animal's milking ability. For sires, this EBV indicates the effect of the daughter's milking ability, inherited from the sire, on the 200-day weights of her calves. For dams, it indicates her milking ability.

**Scrotal Size EBV (cm)** is calculated from the circumference of the scrotum taken between 300 and 700 days of age and adjusted to 400 days of age. This EBV is an estimate of an animal's genetic merit for scrotal size. There is also a small negative correlation with age of puberty in female progeny and therefore selection

for increased scrotal size will result in reduced age at calving of female progeny.

**Days to Calving EBV** (days) indicates the fertility of the daughters of the sire. It is the time interval between the day when the female is first exposed to a bull in a paddock mating to the day when she subsequently calves. A negative EBV for days to calving indicates a shorter interval from bull-in date to calving and therefore higher fertility.

**Carcase Weight EBV** (kg) is based on abattoir carcass records and is an indicator of the genetic differences in carcass weight at the standard age of 750 days.

**Eye Muscle Area EBV** (sq cm) is calculated from measurements from live animal ultrasound scans and from abattoir carcass data, adjusted to a standard 400 kg carcass. This EBV estimates genetic differences in eye muscle area at the 12/13th rib site of a 400 kg dressed carcass. More positive EBVs indicate better muscling on animals. Sires with relatively higher EMA EBVs are expected to produce better-muscled and higher percentage yielding progeny at the same carcass weight than will sires with lower EMA EBVs.

**Rib Fat and Rump Fat EBVs** (mm) are calculated from measurements of subcutaneous fat depth at the 12/13-rib site and the P8 rump site (from live animal ultrasound scans and from abattoir carcasses) and are adjusted to a standard 400 kg carcass. These EBVs are indicators of the genetic differences in fat distribution on a standard 400 kg carcass. Sires with low, or negative, fat EBVs are expected to produce leaner progeny at any particular carcass weight than will sires with higher EBVs.

**Retail Beef Yield EBV** (%) indicates genetic differences between animals for retail yield percentage in a standard 400 kg carcass. Sires with larger EBVs are expected to produce progeny with higher yielding carcasses.

**Intramuscular Fat EBV** (%) is an estimate of the genetic difference in the percentage of intramuscular fat at the 12/13th rib site in a 400 kg carcass. Depending on market targets, larger more positive values are generally more favourable.

**Docility EBV** (%) is an estimate of the genetic differences between animals in temperament. Docility EBVs are expressed as differences in the percentage of progeny that will be scored with acceptable temperament (ie. either "docile" or "restless").

## SELECTION INDEXES

There are currently two different selection indexes calculated for New Zealand Angus animals. These are Self-Replacing and AngusPure. Each selection index describes a different production/market scenario and relates to a typical commercial herd in New Zealand that is targeting the following specifications.

Index values are reported as EBVs, in units of relative earning capacity (\$'s) for a given market. They reflect both the short-term profit generated by a sire through the sale of his progeny, and the longer-term profit generated by his daughters in a self-replacing cow herd. More information is available on selecting animals using a selection index.

The Index values are derived using BreedObject technology. More information is available from the BreedObject web site.

**Self-Replacing Index (\$)** - Estimates genetic differences between animals in net profitability per cow joined for a self-replacing commercial herd, targeting the production of grass finished steers. Steers are assumed marketed at 525 kg live weight (280 kg carcass weight and 10 mm fat depth) at 16 months of age.

**AngusPure Index (\$)** – Estimates genetic differences between animals in net profitability per cow joined for a self-replacing commercial Angus herd, targeting the production of grass finished steers for the AngusPure programme. Steers are assumed marketed at 525 kg live weight (280 kg carcass weight and 10 mm fat depth) at 18 months of age with a significant premium paid for marbling.

Note that \$Index values for individual animals are sensitive to the assumptions used in the BreedObject analysis to calculate the selection index. More information is available on the weightings used in the New Zealand Angus Selection Indexes.

## ACCURACY

**Accuracy (%)** is based on the amount of performance information available on the animal and its close relatives - particularly the number of progeny analysed. Accuracy is also based on the heritability of the trait and the genetic correlations with other recorded traits. Hence accuracy indicates the “confidence level” of the EBV. The higher the accuracy value the lower the likelihood of change in the animal’s EBV as more information is analysed for that animal or its relatives. Even though an EBV with a low accuracy may change in the future, it is still the best estimate of an animal’s genetic merit for that trait. As more information becomes available, an EBV is just as likely to increase in value, as it is to decrease.

Accuracy values range from 0-99%.

As a rule, animals should be compared on EBVs regardless of accuracy. However, where two animals have similar EBVs the one with higher accuracy could be the safer choice, assuming other factors are equal.

For further information please contact NZ Angus or BREEDPLAN.

Totally Vets offers a comprehensive on-farm and in-clinic veterinary service. Our branches in Feilding, Awapuni and Taumarunui complement this service with carefully chosen animal health products and merchandise with up-to-date advice on their use.

Totally Vets offers the complete range of health and production services for all beef enterprises from traditional cow-calf breeding herds through to high-performance finishing services.

**SERVICES INCLUDE:**

- BVD management
- Beef cattle scanning and reproductive advice
- Beef herd synchrony
- Bull testing
- Drench testing
- Lepto advice and vaccination programmes
- Trace element testing and tailored farm plans

**FEILDING** | 06 323 6161  
**AWAPUNI** | 06 356 5011  
**TAUMARUNUI** | 07 895 8899

**TOTALLY VETS**

## It all starts with a fit bull team

Waiting weeks into mating to find out if your bull team is working is like playing Russian roulette.

All aspects of synchrony programmes, collection for AI, semen processing and storage can be catered for.

To ensure your bull team are in top shape for the breeding season we check libido, mounting capability and provide an anatomical and semen evaluation.

- On-farm fertility evaluation, collection and processing
- Animal welfare friendly - Our experienced technicians use a natural service technique using an AV (artificial vagina) as our preferred method.

## Tararua Breeding Centre

- Export approved semen collection centre
- EU Registered semen collection centre
- Offering all aspects of import/export of semen and embryos
